File Based Configuration

MBox Viewer supports Windows Registry based and the file based configuration.

By default, Windows Registry is used to store configuration data.
During startup, the MBox Viewer will check whether the MBoxViewer.config file exists and is writeable in:

1. the Config subfolder under the MBox Viewer software installation folder or
2. in the UMBoxViewer\Config subfolder under the user specific folder created by Windows system
        example: C:\Users\UserName\AppData\Local\UMBoxViewer\Config

The config file format is similar to the format of ".reg" registry file

[UMBoxViewer\LastSelection]
"parameter"="value"

White spaces are not allowed in the front of each line and around "=" character.
All parameter values are encoded as strings and converted by MBox Viewer to numbers or other data types when needed.

MBoxViewer.config file must be encoded as UTF16LE BOM file

MBoxViewer.config.sample file is included in the software package under the Config folder.

In order to enable MBox Viewer to use the file based configuration,
user needs to rename this file to MBoxViewer.config file or copy the sample file
to C:\Users\UserName\AppData\Local\UMBoxViewer\Config folder and rename.
